

Survitec develops new Rope Access lifejacket for the offshore industry

Survitec Group has developed a new Crewsaver branded Rope Access lifejacket designed specifically for people operating at height in an offshore environment. The product has a number of unique features built into its design to ensure it delivers exceptional performance even in the toughest offshore conditions.

The company, which has many years experience in the oil and gas market, has worked closely with leading offshore operators during the product's development. Tried and tested to work in conjunction with a fall arrest harness, the twin chamber jacket provides 275N of buoyancy and is SOLAS approved.

Key features ensure the jacket is ideally suited to an offshore environment. The top half of the lifejacket's outer cover is made from a wipe clean and light weight material that provides added flexibility around the neck area. This is critical to making sure the lifejacket does not push the wearer's helmet forward in use.

The main working area of the jacket is made with a wipe clean, heavy duty material that helps to maintain longevity. A quick burst zip with three burst points has also been built into the lifejacket to help prevent foreign objects getting inside the operating systems.

Inside the jacket offers exceptional turning speed and unrivalled freeboard. Excellent chin support helps to keep the airways clear when in the water. The jacket is equipped with a SOLAS approved light, whistle and reflective tape to ensure the wearer can be located quickly. Accessible lifting points on the front of the jacket aid retrieval should the wearer fall into the water.

Other features include an ID window pocket, snag free soft pull inflation tabs and a crotch strap cover to prevent the strap twisting and snagging. The lifejacket is PLB and AIS ready. An area on the cover has been reserved for printing a company logo.
