

Hughes Pumps test and flush flow-lines in Brazil's Campo Basin

Two flushing and testing systems, manufactured and supplied by leading UK specialist Hughes Pumps, are proving the integrity of flexible flowlines being laid to the seabed in up to 2,200m water offshore in Brazil's Campo Basin.

A Hughes Pumps flexible line hydrostatic test and chemicals injecting system (HTCIS) is being used to pressure test the integrity of flexible lines before oil is pumped through them, with a flushing and hydrostatic test unit (FHTU) being used to flush and pressure test umbilical's integrity before they are connected to subsea control valves.

Hughes Pumps has more than 30 years experience delivering exceptional performance and reliability to the offshore Oil and Gas industry in some of the harshest environments imaginable.
