

## **Smart innovation delivers maximum efficiency for offshore drill rig maintenance**

A powerful water-jetting unit, which uses a smart innovation, is helping deliver essential corrosion prevention maintenance to a semi submersible offshore drilling rig that works extensively in the harsh North Sea, UK environment.

The Stena Spey self-propelled, semi-submersible, offshore drilling rig based in Aberdeen, as with all offshore assets, requires constant maintenance to prevent corrosion. The Hughes Pumps Ultrabar 10 unit will allow engineers to strip corrosion and failed coatings from the rig structure using plain water.

This water-jetting unit is probably the most compact UHP pump set on the market, with minimal water consumption and no abrasive usage making this unit ideal for offshore maintenance.
